

Clathrus archeri

It seems that not is toxic but the smell disgusting that emanates it makes it inedible.

Native to Australia and Tasmania but is now located in others continents too.

Class: Agaricomycetes

Order: Phallales

Family: Clathraceae

Issue: Mushrooms 2021

Romania

Cancellation: Bucarest

06-05-2021. First day

Edition: Romfilatelia

Chlathrus ruber

Inedible. No gastronomic value. Not much inviting especially for the nauseating smell.

However, according to rumors not confirmed in some Northern European nations it is consumed without problems when it is young.

Class: Agaricomycetes

Order: Phallales

Family: Clathraceae
