

Coprinus disseminatus

Common and widespread, it occurs gregariously very numerous and very dense colonies, often collated, rarely tufted; it grows on roots, on buried sticks, in the woods but also in the parks and gardens. Without any value food, for the tiny size and the smallness of the flesh.

Class: Agaricomycetes

Order: Agaricales

Family: Psathyrellaceae

Issue: Mushrooms 2010 Taiwan

Cancellation: Sun Moon Lake 25-03-2010.

First day

Edition: not identified

Coprinus picaceus

It is not very inviting due to the disgusting smell. Pretty common, especially in moist, greasy and soils rich in humus.
